

The ABCDs of Climate Action

Tip!

Share this poster by email with colleagues or print off and post on your staff notice board to start climate conversations in your setting.

A_{daptation}

Make your setting more resilient to the effects of climate change, such as heatwaves, heavy rain, or extreme cold. It's about ensuring your buildings, outdoor space and day-to-day operations can cope with these challenges, while keeping staff and learners safe and healthy. It requires planning ahead to ensure your setting can continue to function despite changing conditions.

B_{iodiversity}

The variety of plants, animals, and ecosystems that exist in and around your setting. Protecting and encouraging nature in and around settings—through green spaces, wildlife habitats, and outdoor learning—helps learners of all ages connect with the environment, supports wellbeing, and can make outdoor space more resilient to climate events. It's about valuing nature as part of your setting's day to day life while contributing to wider efforts to restore and protect the natural world for the future.

C_{limate} education

Giving learners of all ages the knowledge and abilities they need to understand climate change and take action. This includes integrating sustainability topics such as energy, waste, and nature into all aspects of learning and play, while also supporting the development of practical skills for green jobs of the future. By embedding climate learning across subjects and everyday activities, your staff and learners can build confidence to make informed choices, reduce environmental impact, and prepare for careers that support a low-carbon, sustainable society.

D_{ecarbonisation}

Reducing the amount of Greenhouse Gas emissions (such as Carbon Dioxide) your setting produces across all areas of your operations, such as the products you buy, energy you use, waste, travel to and from your setting, food and more.

For example, it can include choosing low-carbon products and suppliers, reducing energy use with LED lighting or smart controls, switching to renewable electricity, managing waste through recycling and reuse, encouraging walking, cycling, or public transport instead of car travel, and offering more plant-based or locally sourced food. The goal is to reduce your setting's emissions while cutting costs, improving comfort, and showing leadership on climate action.
